Complete length inputs for the fifth application in Topic B

Human Compression Project

Input edition; no compression factor

This packet adds one original manuscript: Fernandes and Leemans, *C-groups of high rank for the symmetric groups*, accepted institutional manuscript (2018), DOI 10.1016/j.jalgebra.2018.04.031. The exact edition has one publisher cover and twenty authored pages. It is not the final journal PDF or the earlier arXiv edition. The scientific ledger's thirty-five clauses and five principal targets are not additional manuscripts.

Topic B keeps its complete existing five-page common paper, all four previous applications and the entire earlier program bundle. It adds the whole ten-page common paper, eleven-page application and seven-page program appendix. Repeated arguments are not deducted before a genuinely unified edition receives review. This is a fifth application in an existing topic, with no discount across topics.

Complete document	Pages	Raw untrimmed	Calibrated selected
L040 source, including cover	21	51,894	51,152
Complete additional common paper	10	28,423	28,412
Complete fifth application	11	31,284	31,271
Complete four-program appendix	7	13,170	13,163
Article-only source sensitivity	20	51,113	50,371

The displayed unit is NFC nonspace characters. The primary source count retains the cover. Article-only sensitivity directly extracts all twenty authored pages; it is not obtained by subtracting a token count. Topic B retains its existing primary representation: complete literal rendered N001 text and raw untrimmed PDFs for every other document, including these additions. Selected and calibrated variants remain separate sensitivities.

All four mathematical programs are printed without pruning. Their whole raw lengths are 4,996, 1,428, 4,012 and 1,894 nonspace characters. The first supplies required primitive-catalogue inputs. The next two validate written uniform arguments. The fourth recovers the auxiliary degree-eight example and checks the branching correction; it is not a premise of the five principal results. All four remain charged in the declared program bundle. Printed and raw representations are alternatives, never added together.

The two operational drivers have 10,902 and 7,708 characters. The Lean file has 4,668 and contains eight scoped declarations. These files remain separately inventoried. There is no claim of full formalization. The fixed input grid contains 120 complete-PDF cells, thirty direct article-only cells and seventy whole-raw-file cells. No factor is calculated before distinct input review.

Accepted mathematical scope

The existing admission governs this input audit. It covers the complete classifications at ranks $n - 1$ for $n \geq 7$ and $n - 2$ for $n \geq 9$, all allowed tree branching, the full subgroup intersection property, flag transitivity and exact corrected presentations. The false literal branching clause is not silently treated as proved. The auxiliary historical primitive-rank census and the numerical convention for counting leaves remain excluded or unresolved as recorded in the scientific map.

Whiston's maximum-family and omission statements remain retained through the exact Cameron–Cara interfaces; the original complete Whiston proof is unavailable in the packet. Maróti's primitive alternatives retain their full hypotheses. The GAP primitive catalogue and exact finite-group routines are declared computational inputs. Their construction and the complete outside proofs have unknown costs. Eight Lean declarations establish quotient normalization and independence; they do not establish the rank bounds, finite classification, tree attachment, presentation or geometry.

What the extraction does and does not measure

Every physical page is included. Selected variants remove only exact repeated title/author running headers and isolated page numbers. Front matter, cover text, abstract, references, acknowledgments, addresses and extracted diagram components remain. The accepted-manuscript watermarks and publisher artwork are visible graphics that do not all return as text. Full graphics are not assigned zero cost.

The returned raw text is checked against a separate uninstrumented pypdf extraction. The source's actual embedded font dictionaries, effective encodings, bytes and outlines are matched to every extracted nonspace character. The combined audit contains 27 Type1 dictionaries and 667 used glyph classes. All fifty-eight exceptional classes were inspected in actual-outline panels. Fifteen calibrated classes account for 173 replacements: script capitals, the separate arrow-bar component and nine straight diagram-stroke classes. Stroke symbols record direction only, not precise angle, length or graph assembly.

Twenty-four XYCIRC classes draw curved components of graph vertices. Their literal decoded names, such as `/c23`, remain unchanged in every variant because there is no exact Unicode equivalent for the individual octants. No circle is inferred from a sequence of components. This makes the text length sensitive to the PDF's drawing representation. Calibration is a documented sensitivity, not a reconstruction of all mathematical diagrams. The code appendix's visible line-wrap markers also remain in its measured text.

Checks and reproducibility

All forty-nine source, common, application and program pages were visually inspected. The checker reconstructs all 220 cells, verifies each entire program's inclusion and rejects 34 boundary, glyph, code and scope corruptions. It does not rerun GAP or Lean or reconsider the distinct scientific acceptance.

Every document uses raw untrimmed, raw selected and calibrated selected text, NFC and NFKC, and five units: whitespace tokens, alphanumeric runs, nonspace characters, collapsed characters and collapsed UTF-8 bytes. The source article-only sensitivity uses the same grid. These are representation-sensitive lengths, not a universal measure of mathematical difficulty. Retained external proofs, historical software, full graphics, catalogue construction and a complete formalization have null costs.

Portable replay requires the exact public files and the separately supplied primary PDF. Primary text, font programs and source-page images are not redistributed. A distinct input review must precede any update of Topic B's factors.
