Supported kernels, translation lattices and finite marked quotients

Proposed complete measurement inputs

The boundary compares eight already admitted originals with one complete common paper and eight complete applications. The new common paper replaces the declared duplicated arguments; no previous common manuscript is a free premise. All source contracts and their corrections remain. This packet records lengths, not compression factors, and awaits an independent input review.

The primary coordinate preserves the current A and Affine convention: calibrated, furniture-selected NFC text, counting non-whitespace characters. Raw-untrimmed and raw-selected text, NFC and NFKC, and five units are all retained (30 coordinates per PDF). The tables show the primary coordinate only. Only exact page furniture is removed; titles, proofs, complete tables, bibliographies and wrappers are charged.

Original	Complete source title	Pages	Characters
L032	On regular polytopes of 2-power order	8	16,558
L034	Existence of regular 3-hypertopes with 2^n chambers	11	21,433
F016	Symmetric polytopes whose automorphism groups are 2-groups	19	43,983
F013	String C-groups of 2-power order project onto a common string C-group	11	25,562
L035	Existence of regular 3-polytopes of order 2^n	22	51,019
N009	String C-groups of order 1024	22	36,824
L128	Hypertopes with prescribed diagram symmetries	9	18,424
L012	Regular 3-polytopes of order $2^n p$	17	32,767

Paper	Complete replacement	Pages	Characters
U	Complete common theory	23	66,140
A1	Two-power orders	4	8,228
A2	Three-generator hypertopes	3	5,801
A3	Square sections and free extensions	6	15,436
A4	Common two-group quotient	3	6,241
A5	High-type two-groups	6	14,514
A6	Order-1024 markings	11	28,130
A7	Prescribed diagram symmetries	3	8,825
A8	Mixed-prime polyhedra	9	23,401

All 119 source pages and all 68 replacement scientific pages are included. The 240 source coordinates and 48 collapsed-text hashes reproduce the prior accepted inputs exactly. Source visible-glyph mappings are reused with their exact PDF, font and context bindings; this is not a new full source-outline audit.

Complete computational and other inputs

All three appendices are measured in full, adding 30 pages. The eleven whole computational files include the phase78 presentation data and mathematical replay driver. These are required proof inputs, not free output tables. Their printed and raw-file lengths are alternative representations, never two additive copies.

Complete appendix	Pages	Characters
Two-group computation (four whole files)	21	53,035
Affine computation (six whole files)	8	17,250
Diagram computation (one whole file)	1	1,175

The separate raw inventory also contains all three inherited affine auxiliary scripts, the two current packet drivers and all fourteen unchanged Lean modules. The latter provide only their declared partial formal results: the new arbitrary-parabolic theorem and complete applications are not formalized by them. There is no new theorem, source, question or formal credit from this measurement.

Symmetric manuscript boundary. The eight originals and the nine scientific replacement papers contain no unmatched executable listing under the bound listing screen. Mathematical proof and algorithm prose remain included. Separate executable appendices and raw software are fully inventoried. No software-inclusive factor is justified by this inventory: the complete historical software boundary and external library/database costs are unknown. A future application comparison must identify the whole common paper and every actual required computational or retained mathematical premise already acquired; optional checking is not silently made a theorem premise.

What is and is not measured. Twenty PDFs, comprising 217 physical pages, produce 600 metric cells; thirty complete raw files produce 300 more. All eleven program/data files are verified in the full TeX and printed appendices. Inclusion alone ignores whitespace and the printing wrap markers; the measured PDF text retains them. The new PDFs have no inferred glyph substitutions: all extracted controls/private-use/replacement characters are checked, and all font dictionary, encoding, ToUnicode and embedded-stream identities are bound.

The old source-page and glyph reviews and the exact unified-paper visual receipts are explicitly reused. No fresh review of all 217 pages, execution of GAP, or Lean compilation is claimed. L035 has raster-only scientific labels on pages 9, 10, 12 and 22; the image on page 22 is clipped by the page boundary. Their full visible text cost, all diagram structure, retained external proofs, and installed software and databases remain unknown, not zero.

The scientific boundary is the author freeze `3a51b6f9` and distinct root review `f81a0294`. Exact source editions, hashes and full reproduction instructions are in the accompanying JSON and README. This proposal changes no published factor and exports no primary text or page raster.
