Review of text ownership in the Topic B proof graphs

Independent accounting review

11 October 2026

1 The comparison being preserved

The complete-topic comparison pays for the full common paper and all four applications. An individual application comparison presupposes that the whole common paper has been acquired. The explanatory graph does not replace either denominator by a selected route through a proof. There is no required mathematical program in this topic. Outside classification proofs and unmeasured graphical content have no assigned expanded cost.

For the primary coordinate, the three available historical PDFs contribute $57\,539$ non-whitespace characters, and the five current papers contribute $59\,061$. If x denotes the unavailable original PDF cost of N001, the complete comparison remains $(x + 57\,539)/59\,061$. B1 is included in that denominator. The three known conditional comparisons are unchanged. No number is substituted for x.

2 Independent accounting

I independently re-extracted the eight available complete PDFs with the adopted parser, checked their editions and physical pages, and reconstructed the accepted furniture removals and calibrated glyph occurrences. This uses the previous font review; it does not claim a new visual review of the fonts. Every selected character belongs to exactly one of 217 disjoint spans, assigned to 214 owners. All text remains represented, including context, references and excluded source claims.

The independent checker imports no author allocation, extraction or graph functions. Its character scanner reproduces all 2,140 owner metric cells and all eighty complete-document cells: five units under each of NFC and NFKC. It checks normalization across span boundaries, charges each token or collapsed whitespace run to its first character's owner, and confirms the 428 CSV rows. It separately reconstructs the sixty paired source-clause closures and the four complete application closures. Each cost is a union of owners before summation. Thirteen deliberate corruptions are rejected, including gaps, overlaps, omitted statements, duplicate charging and invented costs for unknown inputs.

Parent and branch boxes may refer to the same passage. A branch carries its full shared theorem statement; the parent contains its branches. These are interfaces to disjoint text owners, not additional objects to charge. The sixty-one owners outside the selected interfaces remain in the full paper totals. Every substantive new proof owner occurs in an interface. Retained theorem statements are charged where printed, with their outside proofs still recorded as unknown.

3 Reading and the labeling correction

I read the beginning and end excerpts for every owned span and inspected the explicit supplements that connect setup and separately printed proof text to the relevant theorem. I also read the independent mathematical graph review. That review, rather than a new complete reading of every historical proof here, supplies the assessment of mathematical dependencies. This accounting review found two inaccurate categories. The spans owned by N008, Lemma 3.6 and Theorem 3.4, contain their statements

only. The former is an unexpanded exercise in the source; the latter has its later proof already included through a separate owner in the theorem interface.

The additive revision changes precisely those two owner categories and their two span categories, together with the corresponding CSV labels. I compared it with the immutable original packet. All offsets, text hashes, physical pages, weights, interfaces and closure costs are unchanged; the weight file is byte-identical. These repairs do not introduce a new mathematical qualification or alter source admission.

The corrected ownership layer is accepted for explaining the previously accepted costs and proof routes. It is not a minimum-proof certificate, a raw-node compression ratio, a new verification of the historical external classifications, or a new Lean run. It assigns no additional recovered result or solved-question credit. The complete written comparisons remain the numerical report.
