Full original(s)
Full common theory
Complete application(s)
A: Supported kernels and finite two-groups
B: Coset geometries and symmetric group markings
C: Chamber operations and binary translations
D: Stabilizer actions and geometry enumeration
E: Projective groups and string markings
F: Odd kernels and tight hypertopes
G: Linear spaces and incidence residues
Affine: Affine groups and lattice quotients
Represent.: Realizing groups as geometry automorphisms
Chamber: Chamber systems and regular covers
Matching: Matching extensions of centrally symmetric polytopes
Chiral: Complete enumeration of chiral polytopes
Diagonal: Orbit and semidirect constructions
