# Executable listings and manuscript lengths

Proposed symmetric input boundary

The current Chamber, ChiralEnumeration and Operations comparisons count embedded source programs while their replacement scientific papers contain no executable listings. We propose excluding the concrete listings on both sides. This changes a measurement boundary, not the mathematical contracts. Required algorithms, computations, witnesses, data and retained theorems remain required.

The complete boundary is six originals and eleven replacement papers: seventeen PDFs and 215 pages. Every title, proof, mathematical algorithm description, table, reference and application companion remains included under its existing furniture and glyph policy. All eleven replacement listing masks are empty. Fourteen documents are unchanged exactly.

| Source | Physical pages | Blocks | Material excluded |
|---|---|---|---|
| L008 | 8–10 | 3 | General Magma functions |
| L028 | 9–12 | 3 | Enumeration functions/procedure |
| N006 | 20 | 1 | McL construction pseudocode |

These are implementations or construction code, not optional validation. Literal program comments are part of their code blocks. The seven blocks split into twelve exact page-local chunks, so source headers and page numbers keep their previous treatment. Original whitespace remains as separators. L028's Lemma 4.5 and proof, located in the same section as its code, remain counted.

The primary unit remains NFC nonspace characters in calibrated selected text. The other four units, NFKC, raw/furniture-retained and uncalibrated selected variants remain available. Operations retains its separate text-only graphical sensitivity. No diagram is silently reconstructed, and full graphical or historical software costs remain unknown.

| Source | Previous primary text | Without executable blocks |
|---|---|---|
| L008 | 21,784 | 20,159 |
| L028 | 29,599 | 27,594 |
| N006 | 56,001 | 55,740 |

These are proposed input lengths, not compression factors. All 600 prior document coordinates were reproduced before applying the masks; 500 remain unchanged. The 46 inherited whole program, decoder, driver and partial formal files remain separately bound. No software-inclusive comparison is licensed by these lengths. Optional checks are not theorem premises; actual required computations and outside theorems remain prerequisites.

The policy and masks were fixed before new counts. An independent review must accept the source boundaries and recount before any ratios are restored. No source, conjecture or formal proof credit changes.
